

AI VISIBILITY MEASUREMENT

Credible PR

Prepared for Max Muir - 2026-09-08

0 of 191

Credible PR appears in 0 of 191 AI responses measured.

Buyer-intent prompts: 0 of 41 (95% CI 0.0-8.6%).

ENGINE claude - **MODEL** claude-sonnet-4-6 - **TEMPERATURE** 0.0

PROMPTS 30 (5 families of 6) - **RUNS/PROMPT** 5-7 - **ATTEMPTED** 210 - **CLEAN** 191

BANK pr_agency_v1 - **EVIDENCE** SHA-256 9eb756a2ca...e4abea - **RUNG** R1

RUNG R1: ran on the operator's machine; not yet reproduced by a stranger. The evidence file and checker shipped with this report exist to change that.

Executive brief

WHAT WAS MEASURED. 30 prompts a prospective client might put to an AI assistant about PR firms, each run 5-7 times against Claude (claude-sonnet-4-6) at temperature 0.0. 191 clean responses; 19 lost to transport errors and excluded from every rate.

WHAT WAS FOUND. Credible PR is named in none of them, in any of the five prompt families. The same measurement shows which firms are named (page 3), so the zero is a property of the answers, not of the instrument.

WHAT THIS DOES NOT SAY. This measures what models answer, not what people ask. It carries no information about search volume or revenue. One engine. Name extraction is pattern-matching against a declared list of 23 firms, and its error rate is unmeasured until our agreement study publishes.

Three actions

1. Re-run this bank on a second engine.

Is the zero Claude-specific? Cost class: ~\$1.

2. Run the identical bank on one client market.

Is the client winning its market? Cost class: ~\$1 per market.

3. Baseline now; re-measure 30 days after the next placement lands.

Does a placement move AI answers at all? Cost class: pilot Join 1.

The competitive picture

Presence in buyer-intent responses, n=41 per candidate. Whiskers are 95% Wilson intervals. 16 other candidates also at 0/41 (table below).

candidate	buyer_int n=41	category n=41	compariso n=25	long_tail n=42	problem n=42
Edelman	6	28	6	0	0
Weber Shandwick	6	21	0	0	0
Clarity PR	0	22	0	0	0
Burson	0	13	5	0	0

What the model says - quoted by hash

Every one of the 191 responses is in the evidence file, hash-bound, exactly as collected. These two are quoted by hash; selection was mechanical (first two buyer-intent rows naming three or more candidates and containing no terms this report itself refuses to use).

What this report refuses to claim

NO COMPOSITE SCORE.

A single blended number hides which component moved and invites weighting choices that flatter. Every rate here stands alone with its denominator and interval.

NO ORDERING CLAIM.

First-three is a position count. No order-bias test has been run on this bank, so no ordering claim is made.

NO EXTRACTION-ERROR FIGURE.

Name extraction is pattern-matching against the declared list of 23. Its agreement with human judgement is being measured, with the labelled set to be published; until that number exists, none is quoted.

NO DEMAND CLAIM.

This measures the supply side - what models answer. Nothing here estimates what people ask or what it is worth.

NO CAUSAL CLAIM.

Whether placements or any other intervention move these rates is exactly the open question a pilot is designed to measure.

ABSTENTION RULE.

Where run-level data cannot support an interval, the report abstains rather than estimates. This run: the candidate list of 23 clears the five-name floor everywhere, so nothing was suppressed.

Each refusal names what would unlock the claim. Ask.

Check this yourself

WHAT SHIPPED WITH THIS PDF

pr_agency_run4.jsonl - the raw evidence: every response, its request payload, its hash.

verify_evidence.py - a checker that needs only standard Python. No install, nothing from us.

```
cd <the folder containing both files>
python verify_evidence.py pr_agency_run4.jsonl \
  --expect 9eb756a2ca6ae2175bfe55a09d5b2c99b30e1451c2cd60050ddc0d1e2ee4abea
# expected last line: VERDICT PASS
```

WHAT PASS MEANS: the stored text and the stored hashes are consistent with each other. The file has not been edited since it was written.

WHAT PASS DOES NOT MEAN: that the responses came from the engine named in the payload, or that the run happened as described. A hash cannot establish either. Ask for the console receipt and the probe record.

If you run this and the verdict is anything but PASS, that is a finding - send it back.
